

As part of my training in IT DUT, I made an internship of 10 weeks in the company Frontware International located in Bangkok.

My various missions which were given to me are situated on a Web site of management of presence to check the hours of work of employees in a company, the application is Weladee. This website contains several features and is connected to a mobile application as well as RFID tags. The purpose of my mission is that this site has to be coded with functions gRPC instead of the API REST. I was in charge largely of this migration and of the management of the requests for holidays of the employees which make them on their mobile phone.

This internship allowed me to develop skills in the two languages used : Javascript and Golang and in the microservice gRPC. In addition to this contribution of knowledge, I was able to discover the work environment professional abroad in a company that produces services in the world and have professional experience in computer science leaving the school.

I also learned to live in a foreign country and totally different from France, so I have to adapt myself despite the difficulty of communicate with everyone around me. Employees in Frontware International were helpful with us and there was a good working atmosphere.

I sincerely believe that this internship was a good professional experience to finalize my two years of study.
